

Re:Plan

An AI productivity planner with personality literally. Pick an AI persona (Tsundere, Yandere, Kuudere, Deredere, or Chaotic Gremlin), and watch it plan your day, notice when you fall behind, and react in character including refusing to help if you keep ignoring it.

The Problem

Most productivity tools rely on passive reminders that are easy to ignore. They don't adapt when you fall behind, and they don't give you any reason to actually act on them. We wanted to build something that *notices*, *reacts*, and *holds you accountable* without being just another to-do list.

The Idea

Instead of one neutral AI assistant, give the user a choice of **5 distinct personalities**, each with a genuinely different planning philosophy not just different wording, but different decisions:

| Persona | Planning style | Voice | | Tsundere | Efficient, denies caring while clearly helping | Female | | Yandere | Tightly packed schedule, obsessively controlling "for your own good" | Female | | Kuudere | Bare-minimum, blunt, no emotional padding | Male | | Deredere | Generous buffers, celebrates small wins, endlessly supportive | Female | | Chaotic Gremlin | Unconventional ordering, weird-but-functional hacks | Male |

The real centerpiece is what happens when you fall behind: the AI doesn't wait to be asked. It **autonomously detects drift, re-plans your remaining day, and explains why** in character. Keep ignoring it across multiple cycles, and it escalates: gentle nudge -> visible frustration -> outright **refusal to help further** until you respond. A second AI call then judges, in character, whether your reply is a sincere enough acknowledgment to restore its help.

Key Features

- 5 personas with distinct planning philosophies (not just tone)
- Autonomous drift detection + auto re-planning, no user action required
- Escalation system (calm -> nudge -> frustrated -> refusal) driven by both live schedule drift and a persistent "consecutive ignored replans" counter
- AI-judged unlock/reconciliation flow after a refusal
- Automatic persona-voiced text-to-speech on every AI response
- Google Calendar-style time-blocked schedule view, color-coded by priority
- "Help Me Start" AI-generated first step for any task, to break procrastination
- Demo Mode time acceleration, so the autonomous behavior can be observed without waiting in real time

How It Works (Architecture)

User adds tasks (title, deadline, est. duration, priority) -> Persona-conditioned PLANNER prompt (Gemini) -> time-blocked schedule -> Drift Detector (runs client-side, on a timer + on task status changes)

- compares current time against schedule block end-times
- tracks consecutive ignored replans, separate from live drift -> Persona + stage-conditioned REPLANNER prompt (Gemini)
- stages 0-2: revises remaining schedule, explains changes in character
- stage 3: REFUSES returns blocks unchanged, locks further help -> [if locked] User replies -> UNLOCK-CHECK prompt (Gemini) judges in character whether the reply is a sincere acknowledgment -> Accepted -> unlocked, trust partially restored (resets to stage 1, not 0) Rejected -> stays locked, persona responds in character

All Gemini calls request strict JSON output and are parsed defensively on the server side. Persona behavior (planning philosophy, escalation style, voice pitch/rate) is stored in a single config object, so each persona is a data definition, not duplicated prompt logic.

Tech Stack

- **Frontend:** React, TypeScript, Tailwind CSS, Lucide React (icons)
- **AI:** Gemini API (`gemini-2.5-flash`) via Google AI Studio. If busy, it will fall back to ('gemini-1.5-flash').
- **Voice:** Browser-native Web Speech API (`SpeechSynthesis`), tuned per-persona via pitch/rate parameters
- **Backend:** Node.js server layer (keeps the Gemini API key server-side, never exposed to the client)
- **Persistence:** Browser `localStorage` for session continuity
- **Deployment:** Google Cloud Run (via Google AI Studio's built-in deploy)

Known Limitations / Future Work

- Voice quality depends on the voices available in the user's browser/OS; we fall back gracefully but quality varies across devices
- Drift detection currently runs on a simulated/accelerated clock for demo purposes a production version would tune this to real elapsed time and add push notifications
- No multi-day planning yet currently scoped to a single day's schedule
- Persona personality config is easy to extend; more personas (Golden Retriever, Sarcastic Best Friend, Grumpy Mentor, etc.) were scoped but not built due to time constraints

Team

Choose Your Planner's Personality

Select who will design your day. Each personality has a unique planning philosophy, voice, and escalation style if you start falling behind.

Tsundere

Acts annoyed and reluctant but secretly cares a lot. Denies caring even while clearly helping.

PHILOSOPHY

Efficient, no-nonsense scheduling. Insists this is "just logical, not because I care."

Yandere

Sweet on the surface, obsessively controlling underneath. Wants total devotion to the plan "for you..."

PHILOSOPHY

Packs the schedule tightly with minimal slack — wants to control every minute because it "loves"...

Kuudere

Flat, minimal emotional expression, blunt and efficient. Cares, but never shows it.

PHILOSOPHY

Bare-minimum optimal schedule. No padding, no commentary beyond what's necessary.

Deredere

Warm, openly affectionate, endlessly encouraging and supportive.

PHILOSOPHY

Builds in generous buffer/rest time, celebrates small wins, prioritizes not burning the user...

Chaotic Gremlin

Unpredictable, meme-driven, gleefully unhinged but secretly effective.

PHILOSOPHY

Non-obvious task ordering, weird-but-functional hacks (e.g. "do the scary task first while..."

BUSTING PROCRASTINATION WITH TSUNDERE

Sleep

▶ YOUR 2-MINUTE MICRO-STEP

"And for the first step, because you're clearly incapable of anything complex... just put down your phone. Or close that laptop lid. It'll take less than a minute, not that I care about your progress or anything!"

📅 TASK BREAKDOWN / OUTLINE

Hmph, "Sleep," you say? It's not like it's some grand mystery, you know. But fine, since you clearly need a guide for everything, here's a basic outline:

- * Actually "stop" whatever pointless thing you're doing.
- * Make your way to your pathetic excuse for a bed.
- * Then just... lie there and "try" to sleep, okay?!

I'm starting now!

In real use, this happens passively over hours — sped up here so you can watch your assistant react in real time.

ASSISTANT COMMENTARY

"Honestly, scheduling 'Sleep' is ridiculous, but fine. I've slotted it in for you. Don't think I'm doing this because I care about your well-being; it's just the most logical place for it to avoid cluttering up other, actually important things. Just get it done."

TTS output: "Hmph, don't get used to this."
